

What Makes Symtx Unique

Symtx is the largest and best known independent system integrator in the US, with more than 20 years of experience in the design and support of functional test systems.

There are fundamental differences in the way we do business that sets Symtx apart from others in our industry:

- **Depth of Expertise:** The experience we have accumulated over more than 20 years and 1500 test systems allows us to supply real value to our customers. We have a large technical staff, located in multiple offices across the US, with expertise in areas such as RF and microwave, optics, high voltage, high speed digital interfaces, and precision analog measurements.
- **No Proprietary Documentation:** Each station we deliver comes with a complete set of production level documentation, including parts lists, schematics, wire lists, cable and mechanical drawings. We provide this documentation in our format or yours, without using proprietary internal part numbers.
- **Source Code Delivery:** All software supplied with our stations is delivered with complete source code, allowing you to update and support this code in the future. You are free to copy and use this software on other stations at no added cost.
- **No Secrets:** Symtx strives to maintain an open, partnering relationship, acting as an extension of your internal test department. That is why we provide complete documentation with our systems. We provide twice monthly status reports on our progress, so you are aware of our progress at all times. We will even put engineers on site at your facility to work as part of your team for concurrent developments.
- **No Product Bias:** As an independent systems integrator, not associated with a product company, Symtx has no bias toward particular, higher profit products. We configure each system starting with a clean sheet of paper, picking the instruments and architecture that minimize your recurring costs, rather than pushing you to use one of our existing test platforms. Our only agenda is to minimize your total cost of test.
- **Performance Based Growth:** Symtx has experienced steady, double digit growth throughout its history. This growth has not come through entrenchment – locking our customers into our proprietary platforms and products. It has come about as a result of our engineering and manufacturing performance, providing superior value at a lower total cost to our customers.

Addressing Your Needs

Symtx is not in business just to sell test stations. Our primary charter is to partner with the internal test departments of our customers, supplying the products and services that you need to meet your production objectives. What is the biggest thorn in your side? We are ready to take it away.

- **Fixtures:** Do you have a problem interfacing to your DUT? Symtx provides precision mechanical fixtures, with auto-alignment to micron accuracy, meeting demanding test requirements. We develop fixtures to meet temperature extremes, environmental constraints, vibration, pressure and vacuum, optical alignment, and other special requirements.
- **Software Porting:** Do you have the need to port your software to a new language, without adequate resources or expertise. Symtx has software expertise in all standard test languages, along with experts who also understand test systems. We can port your software quickly and economically, and deliver a quality product.
- **Build To Print:** Is replication of your existing stations an important need, either due to manpower limitations or budget constraints? Symtx has an efficient manufacturing organization and extensive facilities, optimized for fabrication of test stations, and backed up by an experienced staff of test engineers to resolve any issues that arise.
- **Documentation:** Do you have systems that need to be supported or replicated, but lack a complete documentation package? Rather than assign your valuable test engineers to this task, let Symtx help. We will reverse engineer your stations and provide a complete, production level documentation package in your format.
- **Obsolete Equipment:** Do you have older test stations with obsolete instrumentation or internally designed hardware that can no longer be supported? Let Symtx take over the task of upgrading these stations and replacing the obsolete hardware. We will provide the replacement hardware, software and documentation you need.
- **Standards Development:** Would you like help in architecting an optimal test platform for a new family of products? Let Symtx work with your engineers to create a design that minimizes your total cost of test. We can also help you specify standards and processes that reduce the cost of test development and support.

What ever your functional test requirements, we are here to provide the support your need. So give us a call.
